## 1N5913B Series

## 3 W DO-41 Surmetic 30 Zener Voltage Regulators

This is a complete series of 3 W Zener diodes with limits and excellent operating characteristics that reflect the superior capabilities of silicon-oxide passivated junctions. All this in an axial-lead, transfer-molded plastic package that offers protection in all common environmental conditions.

## Features

- Zener Voltage Range - 3.3 V to 200 V
- ESD Rating of Class 3 ( $>16 \mathrm{KV}$ ) per Human Body Model
- Surge Rating of 98 W @ 1 ms
- Maximum Limits Guaranteed on up to Six Electrical Parameters
- Package No Larger than the Conventional 1 W Package
- Pb-Free Packages are Available

## Mechanical Characteristics

CASE: Void free, transfer-molded, thermosetting plastic FINISH: All external surfaces are corrosion resistant and leads are readily solderable

## MAXIMUM LEAD TEMPERATURE FOR SOLDERING PURPOSES:

$260^{\circ} \mathrm{C}, 1 / 16^{\prime \prime}$ from the case for 10 seconds
POLARITY: Cathode indicated by polarity band MOUNTING POSITION: Any

## MAXIMUM RATINGS

| Rating | Symbol | Value | Unit |
| :---: | :---: | :---: | :---: |
| Max. Steady State Power Dissipation <br> @ $\mathrm{T}_{\mathrm{L}}=75^{\circ} \mathrm{C}$, Lead Length $=3 / 8^{\prime \prime}$ <br> Derate above $75^{\circ} \mathrm{C}$ | $\mathrm{P}_{\mathrm{D}}$ | 3 | W |
| Steady State Power Dissipation <br> @ $\mathrm{T}_{\mathrm{A}}=50^{\circ} \mathrm{C}$ <br> Derate above $50^{\circ} \mathrm{C}$ | $\mathrm{P}_{\mathrm{D}}$ | 1 | W |
| Operating and Storage <br> Temperature Range |  | 24 | $\mathrm{~mW} /{ }^{\circ} \mathrm{C}$ |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Devices listed in bold, italic are ON Semiconductor Preferred devices. Preferred devices are recommended choices for future use and best overall value.
$\dagger$ The "G" suffix indicates Pb - Free package available.

1. TOLERANCE AND TYPE NUMBER DESIGNATION

Tolerance designation - device tolerance of $\pm 5 \%$ are indicated by a "B" suffix.
2. ZENER VOLTAGE $\left(V_{Z}\right)$ MEASUREMENT

ON Semiconductor guarantees the zener voltage when measured at 90 seconds while maintaining the lead temperature $\left(\mathrm{T}_{\mathrm{L}}\right)$ at $30^{\circ} \mathrm{C} \pm 1^{\circ} \mathrm{C}$, 3/8" from the diode body.
3. ZENER IMPEDANCE $\left(Z_{z}\right)$ DERIVATION

The zener impedance is derived from 60 seconds $A C$ voltage, which results when an $A C$ current having an rms value equal to $10 \%$ of the DC zener current ( $\mathrm{I}_{\mathrm{ZT}}$ or $\mathrm{I}_{\mathrm{ZK}}$ ) is superimposed on $\mathrm{I}_{\mathrm{ZT}}$ or $\mathrm{I}_{\mathrm{ZK}}$.

## 1N5913B Series

## APPLICATION NOTE

Since the actual voltage available from a given zener diode is temperature dependent, it is necessary to determine junction temperature under any set of operating conditions in order to calculate its value. The following procedure is recommended:

Lead Temperature, $T_{L}$, should be determined from:

$$
T_{L}=\theta_{L A} P_{D}+T_{A}
$$

$\theta_{\mathrm{LA}}$ is the lead-to-ambient thermal resistance $\left({ }^{\circ} \mathrm{C} / \mathrm{W}\right)$ and $P_{D}$ is the power dissipation. The value for $\theta_{\text {LA }}$ will vary and depends on the device mounting method. $\theta_{\text {LA }}$ is generally $30-40^{\circ} \mathrm{C} / \mathrm{W}$ for the various clips and tie points in common use and for printed circuit board wiring.

The temperature of the lead can also be measured using a thermocouple placed on the lead as close as possible to the tie point. The thermal mass connected to the tie point is normally large enough so that it will not significantly respond to heat surges generated in the diode as a result of pulsed operation once steady-state conditions are achieved. Using the measured value of $T_{L}$, the junction temperature may be determined by:

$$
\mathrm{T}_{\mathrm{J}}=\mathrm{T}_{\mathrm{L}}+\Delta \mathrm{T}_{\mathrm{JL}}
$$

$\Delta \mathrm{T}_{\mathrm{JL}}$ is the increase in junction temperature above the lead temperature and may be found from Figure 2 for a train of power pulses $(\mathrm{L}=3 / 8 \mathrm{inch})$ or from Figure 10 for dc power.

$$
\Delta \mathrm{T}_{\mathrm{JL}}=\theta_{\mathrm{JL}} \mathrm{P}_{\mathrm{D}}
$$

For worst-case design, using expected limits of $\mathrm{I}_{\mathrm{Z}}$, limits of $P_{D}$ and the extremes of $T_{J}\left(\Delta T_{J}\right)$ may be estimated. Changes in voltage, $\mathrm{V}_{\mathrm{Z}}$, can then be found from:

$$
\Delta \mathrm{V}=\theta_{\mathrm{VZ}} \Delta \mathrm{~T}_{\mathrm{J}}
$$

$\theta_{\mathrm{VZ}}$, the zener voltage temperature coefficient, is found from Figures 5 and 6.

Under high power-pulse operation, the zener voltage will vary with time and may also be affected significantly by the zener resistance. For best regulation, keep current excursions as low as possible.

Data of Figure 2 should not be used to compute surge capability. Surge limitations are given in Figure 3. They are lower than would be expected by considering only junction temperature, as current crowding effects cause temperatures to be extremely high in small spots resulting in device degradation should the limits of Figure 3 be exceeded.
