

## LM6161/LM6261/LM6361 High Speed Operational Amplifier

### General Description

The LM6161 family of high-speed amplifiers exhibits an excellent speed-power product in delivering 300 V/ $\mu$ s and 50 MHz unity gain stability with only 5 mA of supply current. Further power savings and application convenience are possible by taking advantage of the wide dynamic range in operating supply voltage which extends all the way down to +5V.

These amplifiers are built with National's VIP™ (Vertically Integrated PNP) process which provides fast PNP transistors that are true complements to the already fast NPN devices. This advanced junction-isolated process delivers high speed performance without the need for complex and expensive dielectric isolation.

- High unity gain freq 50 MHz
- Low supply current 5 mA
- Fast settling 120 ns to 0.1%
- Low differential gain <0.1%
- Low differential phase 0.1°
- Wide supply range 4.75V to 32V
- Stable with unlimited capacitive load
- Well behaved; easy to apply

### Applications

- Video amplifier
- High-frequency filter
- Wide-bandwidth signal conditioning
- Radar
- Sonar

### Features

- High slew rate 300 V/ $\mu$ s

### Connection Diagrams

Temperature Range			Package	NSC Drawing
Military -55°C ≤ T <sub>A</sub> ≤ +125°C	Industrial -25°C ≤ T <sub>A</sub> ≤ +85°C	Commercial 0°C ≤ T <sub>A</sub> ≤ +70°C

## Absolute Maximum Ratings (Note 12)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage ( $V^+ - V^-$ )	36V
Differential Input Voltage (Note 8)	$\pm 8V$
Common-Mode Voltage Range (Note 10)	$(V^+ - 0.7V)$ to $(V^- + 0.7V)$
Output Short Circuit to GND (Note 1)	Continuous
Soldering Information	
Dual-In-Line Package (N, J) Soldering (10 sec.)	260°C
Small Outline Package (M) Vapor Phase (60 sec.)	215°C
Infrared (15 sec.)	220°C

See AN-450 "Surface Mounting Methods and Their Effect on Product Reliability" for other methods of soldering surface mount devices.

Storage Temp Range	-65°C to +150°C
Max Junction Temperature	150°C
ESD Tolerance (Notes 6, 7)	$\pm 700V$

## Operating Ratings (Note 12)

Temperature Range (Note 2)	
LM6161	$-55^\circ C \leq T_J \leq +125^\circ C$
LM6261	$-25^\circ C \leq T_J \leq +85^\circ C$
LM6361	$0^\circ C \leq T_J \leq +70^\circ C$
Supply Voltage Range	4.75V to 32V

## DC Electrical Characteristics

The following specifications apply for Supply Voltage =  $\pm 15V$ ,  $V_{CM} = 0$ ,  $R_L \geq 100\text{ k}\Omega$  and  $R_S = 50\Omega$  unless otherwise noted. **Boldface** limits apply for  $T_J = T_{MIN}$  to  $T_{MAX}$ ; all other limits  $T_J = 25^\circ C$ .

Symbol	Parameter	Conditions	Typ	LM6161	LM6261	LM6361	Units
				Limit (Notes 3, 11)	Limit (Note 3)	Limit (Note 3)	
$V_{OS}$	Input Offset Voltage		5	7 <b>10</b>	7 <b>9</b>	20 <b>22</b>	mV Max
$V_{OS}$ Drift	Input Offset Voltage Average Drift		10				$\mu V/^\circ C$

## AC Electrical Characteristics

The following specifications apply for Supply Voltage =  $\pm 15V$ ,  $V_{CM} = 0$ ,  $R_L \geq 100\text{ k}\Omega$  and  $R_S = 50\Omega$  unless otherwise noted. **Boldface** limits apply for  $T_J = T_{MIN}$  to  $T_{MAX}$ ; all other limits  $T_J = 25^\circ\text{C}$ .

Symbol	Parameter	Conditions	Typ	LM6161	LM6261	LM6361	Units
				Limit (Notes 3, 11)	Limit (Note 3)	Limit (Note 3)	
GBW	Gain-Bandwidth Product	@ $f = 20\text{ MHz}$	50	40 <b>30</b>	40 <b>35</b>	35 <b>32</b>	MHz Min
		Supply = $\pm 5V$	35				MHz
SR	Slew Rate	$A_V = +1$ (Note 8)	300	200 <b>180</b>	200 <b>180</b>	200 <b>180</b>	V/ $\mu\text{s}$ Min
		Supply = $\pm 5V$ (Note 8)	200				V/ $\mu\text{s}$
PBW	Power Bandwidth	$V_{OUT} = 20 V_{PP}$	4.5				MHz
$t_S$	Settling Time	10V Step to 0.1% $A_V = -1$ , $R_L = 2\text{ k}\Omega$	120				ns
$\phi_m$	Phase Margin		45				Deg
$A_D$	Differential Gain	NTSC, $A_V = +4$	<0.1				%
$\phi_D$	Differential Phase	NTSC, $A_V = +4$	0.1				Deg
$e_{np-p}$	Input Noise Voltage	$f = 10\text{ kHz}$	15				$nV/\sqrt{\text{Hz}}$
$i_{np-p}$	Input Noise Current	$f = 10\text{ kHz}$	1.5				$pA/\sqrt{\text{Hz}}$

**Note 1:** Continuous short-circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of  $150^\circ\text{C}$ .

**Note 2:** The typical junction-to-ambient thermal resistance of the molded plastic DIP (N) is  $105^\circ\text{C/W}$ , the molded plastic SO (M) package is  $155^\circ\text{C/W}$ , and the cerdip (J) package is  $125^\circ\text{C/W}$ . All numbers apply for packages soldered directly into a printed circuit board.

**Note 3:** Limits are guaranteed by testing or correlation.

**Note 4:** For single supply operation, the following conditions apply:  $V^+ = 5V$ ,  $V^- = 0V$ ,  $V_{CM} = 2.5V$ ,  $V_{OUT} = 2.5V$ . Pin 1 & Pin 8 (Vos Adjust) are each connected to Pin 4 ( $V^-$ ) to realize maximum output swing. This connection will degrade  $V_{OS}$ ,  $V_{OS}$  Drift, and Input Voltage Noise.

**Note 5:**  $C_L \leq 5\text{ pF}$ .

**Note 6:** In order to achieve optimum AC performance, the input stage was designed without protective clamps. Exceeding the maximum differential input voltage results in reverse breakdown of the base-emitter junction of one of the input transistors and probable degradation of the input parameters (especially Vos, Ios, and Noise).

## AC Electrical Characteristics (Continued)

**Note 7:** The average voltage that the weakest pin combinations (those involving Pin 2 or Pin 3) can withstand and still conform to the datasheet limits. The test circuit used consists of the human body model of 100 pF in series with 1500Ω.

**Note 8:**  $V_{IN} = 8V$  step. For supply =  $\pm 5V$ ,  $V_{IN} = 5V$  step.

**Note 9:** Voltage Gain is the total output swing (20V) divided by the input signal required to produce that swing.

**Note 10:** The voltage between  $V^+$  and either input pin must not exceed 36V.

**Note 11:** A military RETS electrical test specification is available on request. At the time of printing, the RETS6161X specs complied with all **Boldface** limits in this column.

**Note 12:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed.

## Simplified Schematic

DS009057-3

## Applications Tips

The LM6361 has been compensated for unity-gain operation. Since this compensation involved adding emitter-degeneration resistors to the op amp's input stage, the open-loop gain was reduced as the stability increased. Gain error due to reduced  $A_{VOL}$  is most apparent at high gains; thus, for gains between 5 and 25, the less-compensated LM6364 should be used, and the uncompensated LM6365 is appropriate for gains of 25 or more. The LM6361, LM6364, and LM6365 have the same high slew rate, regardless of their compensation.

The LM6361 is unusually tolerant of capacitive loads. Most op amps tend to oscillate when their load capacitance is greater than about 200 pF (especially in low-gain circuits). The LM6361's compensation is effectively increased with load capacitance, reducing its bandwidth and increasing its stability.

Power supply bypassing is not as critical for the LM6361 as it is for other op amps in its speed class. Bypassing will, how-

ever, improve the stability and transient response and is recommended for every design. 0.01  $\mu$ F to 0.1  $\mu$ F ceramic capacitors should be used (from each supply "rail" to ground); if the device is far away from its power supply source, an additional 2.2  $\mu$ F to 10  $\mu$ F of tantalum may provide extra noise reduction.

Keep all leads short to reduce stray capacitance and lead inductance, and make sure ground paths are low-impedance, especially where heavier currents will be flowing. Stray capacitance in the circuit layout can cause signal coupling across adjacent nodes and can cause gain to unintentionally vary with frequency.

Breadboarded circuits will work best if they are built using generic PC boards with a good ground plane. If the op amps are used with sockets, as opposed to being soldered into the circuit, the additional input capacitance may degrade circuit performance.

## Typical Applications

### Offset Voltage Adjustment

DS009057-4

### 1 MHz Low-Pass Filter

DS009057-10

†1% tolerance

\*Matching determines filter precision

$$f_c = (2\pi \sqrt{R1 R2 C1 C2})^{-1}$$

## Typical Applications (Continued)

## Notes

### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
